SUMMARY

Bilingual, collaborative scientist specializing in AI and machine learning for clinical informatics and computational biology. Build LLM-powered systems, agentic AI workflows, and AutoML pipelines for healthcare applications, including postpartum mental health prediction, pediatric diabetes outcome prediction, rare disease and treatment-response phenotyping, clinical note de-identification, and generative disease-trajectory modeling across EHR datasets ranging from targeted clinical cohorts to repositories of 1M+ patients. Combine AI agents and rigorous statistical modeling to extract actionable insights from EHR data and translate them into deployable workflows with AWS and Palantir Foundry platforms. Recognized with NSF GRFP and NLM fellowships; disseminated work through peer-reviewed publications and 20+ posters/talks, with open-source software contributions spanning NASA mission modeling and clinical informatics.

SKILLS

Programming Languages	Python (6+ years), R (3+ years), SQL (3+ years), MATLAB (2+ years), Java (1 year), C++ (1 year)
Python Ecosystem	NumPy, Pandas, SciPy, Scikit-learn, PyTorch, Matplotlib, Seaborn, PySpark, LangChain, LangGraph, Optuna, Hugging Face Transformers, spaCy, NLTK
Machine Learning & AI	Deep learning (CNNs, LSTMs, Transformers), PEFT/QLoRA fine-tuning, prompt engineering, retrieval-augmented generation (RAG), agentic AI and multi-agent system design, AutoML, predictive modeling, clustering, dimensionality reduction, supervised and unsupervised learning
Data Science	Experimental design, hypothesis testing, feature engineering, data wrangling and preprocessing, data imputation, data augmentation, exploratory data analysis, statistical modeling, data visualization
Mathematics	Probability theory, linear algebra, ODEs/PDEs, optimization
Systems & Infrastructure	AWS (SageMaker, Bedrock), Palantir Foundry (Pipeline Builder, AIP Agents, OAG), Docker, Git, Power BI

EDUCATION

Ph.D., Quantitative & Computational Biosciences — Baylor College of Medicine 2022–2027
NSF Graduate Research Fellow (2024) | NLM Fellow (2023) | Dean's Award of Excellence (2024)

B.S., Physics & Mathematics (Double Major) — University of Houston 2018–2022
GPA: 3.95/4.00, Magna Cum Laude | Dean's Distinguished Scholar (2018–2022)

RESEARCH & INDUSTRY EXPERIENCE

AI Developer and Research Design Intern, Peraton, Reston, VA (Remote) Aug. 2026–Present
Cyber Operations, Cyber & Intelligence Sector | Mentor: Ebenezer Dadson

- Work with a team of AI engineers and researchers building software powered by large language models and multi-agent systems
- Focus on how these systems are validated: designing evaluation protocols and controlled experiments that measure the effect of design parameters and system factors on performance and reliability

Graduate Student Researcher, Baylor College of Medicine, Houston, TX 2022–Present

Liu Lab, Data Science Center, Jan and Dan Duncan Neurological Research Institute (NRI), Texas Children's Hospital

Advisor: Dr. Zhandong Liu, Professor

Postpartum Mental Health Prediction (ClinPreAI)

- Developed ClinPreAI, an agentic AI system (research, planning, coding, debugging, and interpretation modules) that autonomously designs, implements, and evaluates machine-learning pipelines for clinical risk prediction
- Predicted early postpartum depression risk (postpartum EPDS $\geq$10; 31% prevalence) from a single antepartum hospitalization using 27 structured clinical variables and social worker notes for 4,161 patients at Texas Children's Hospital
- ClinPreAI reached F1 0.68 (structured) and 0.65 (multimodal), outperforming traditional AutoML, AWS Canvas, and zero-shot LLMs and matching a custom LLM-XGBoost pipeline; led ablation, error, and unsupervised analyses showing prior mental-health history dominates prediction, with clinician review confirming model reasoning
- 1 peer-reviewed publication in *Pregnancy* (DOI: 10.1002/pmf2.70319); 1 first-author manuscript under review at *PLOS Digital Health* (preprint DOI: 10.1101/2025.11.14.25340265); BCM Seed Grant; 5 conference presentations

Pediatric Diabetes (Type 1 and Type 2)

- Built a PySpark preprocessing pipeline on Palantir Foundry that converts raw OMOP CDM and Epic Clarity EHR into analysis-ready longitudinal cohorts for pediatric T2D ($n = 2{,}489$) and T1D ($n = 4{,}018$, including CGM), each represented as a patient $\times$ feature $\times$ visit-window tensor anchored to diagnosis date
- Engineered multimodal features spanning structured clinical variables, CGM glycemic time-series, and LLM-extracted social determinants of health, and defined 7 clinically rigorous binary outcomes with explicit safeguards against data leakage and immortal-time bias
- Designed and benchmarked multi-agent LLM clinical-reasoning architectures (single-pass, chain-of-thought, and modality-specialist agents with synthesis) against 8 classical ML and deep-learning baselines across all outcomes at 2- and 5-year prediction horizons, with modality and architecture ablations
- MedSDoH manuscript under review (*JAMIA*; DOI: 10.64898/2026.04.27.26351699); dkNET NIDDK grant awarded; 3 ADA conference abstracts accepted; TMC AI Summit abstract

Rett Syndrome: Trofinetide (Daybue) Treatment Response

- Developed a dual-LLM consensus pipeline to extract 18 treatment-response phenotypes (4 adverse effects, 13 Rett clinical features, and medication refusal) from 26,763 clinical notes across 108 QC-confirmed trofinetide-treated patients at Texas Children's Hospital
- Architecture: phenotype-specific keyword filtering, independent classification by two complementary LLMs (a clinical-NLP expert and a GI/neurology domain specialist), a consensus gate requiring agreement for a positive call, and patient $\times$ timepoint aggregation over six-month windows to 30 months
- Selected architecture and prompt on an expert-annotated diarrhea development set (183 patient-timepoint cells, 56 patients), reaching 84.2% accuracy and F1 0.674, 47 points above regular-expression matching ($p < 0.0001$); froze the pipeline and applied it out-of-sample to the remaining 17 phenotypes, where expert spot-check agreement reached 90.2% (92/102)
- Classified all 29 residual diarrhea errors by mechanism, showing 89% reflect annotation-threshold or six-month-window placement rather than misreading of the note; 1 first-author manuscript under review at *JAMIA* (preprint DOI: 10.48550/arXiv.2610.22062); pipeline released at GitHub

Clinical Note De-identification (Protected Health Information)

- Led a systematic benchmark of 8 LLMs against two purpose-built de-identification systems (Stanford TiDE, OpenMed PII) and two pattern-based baselines on 100 expert-annotated pediatric oncology notes (5,322 PHI spans) from Texas Children's Hospital via AWS Bedrock
- Introduced the concept of *institutionally-situated PHI* and developed iterative in-context prompt conditions

(HIPAA-aligned baseline, institution-targeted, and precision-focused) to tune the recall–precision trade-off; naming the missed institutional categories recovered 79% (48/61) of them
- Best single-pass configuration achieved F1 0.918 ± 0.001 (vs. TiDE 0.779); demonstrated that 14 multi-agent and ensemble architectures did not outperform a well-calibrated single pass, and used LLM outputs as a discovery tool to surface 414 candidate gold-standard annotation gaps (227 confirmed PHI spans), against which the final prompt reached recall 0.981 (F1 0.907 ± 0.002)
- 1 first-author manuscript under review at the *Journal of the American Medical Informatics Association* (preprint DOI: 10.48550/arXiv.2608.17051)

Pediatric Disease Trajectory Prediction (TEDDY)

- Contributed to TEDDY (Temporal Event Decoder for Disease in Youth), the first generative EHR foundation model purpose-built for pediatrics: a 1.84M-parameter decoder transformer trained with a joint next-code and time-to-event objective on $\sim$1.6M children and $\sim$73M ICD-10 diagnosis codes from the Texas Children's Hospital OMOP repository
- Helped assemble and tokenize longitudinal diagnosis trajectories and shape a leakage-free evaluation protocol combining a visit-structure representation (scoring each new diagnosis before same-day codes are revealed), first-occurrence-only scoring, and sex/age-matched controls to isolate clinical signal from within-encounter leakage and demographic confounding
- Benchmarked TEDDY against same-data sequence baselines (DenseNet, CNN, RNN, LSTM) and a general-purpose LLM three orders of magnitude larger, and quantified how far in advance diagnoses can be anticipated across lead-time horizons
- At 1.84M parameters, attained a median first-occurrence AUC of 0.72 across 797 disease-onset tasks (16 ICD-10 chapters), outperforming every same-data baseline on 96–99% of codes with the strongest gains on the rarest conditions, and retained predictive signal more than two years before first recorded diagnosis
- Preprint available on arXiv (2607.14191)

Research Associate, NASA Ames Research Center, Space Biosciences Division, Mountain View, CA
May–Aug. 2022

Summer research appointment; collaboration continued remotely through Aug. 2026
Mentor: Dr. Jessica Lee, Research Scientist, Space Biosciences Division

- Developed the AMMPER model to simulate cell damage under space radiation and validated it against BioSentinel mission data during the summer appointment, then sustained the project as an ongoing collaboration through Aug. 2026
- Optimized AMMPER computational efficiency by several orders of magnitude; incorporated gamma radiation and alamarBlue metabolic-dye dynamics using Michaelis-Menten kinetics, and built a 3D free-radical diffusion model using propagators
- Mentored and supervised two undergraduate students who carried the project forward after the appointment, covering GUI development, modeling, and statistical analysis; developed Space Biology Cluster educational content for the LabXchange platform
- 4 presentations (NASA management and 2 conferences); 1 first-author manuscript under revision at *American Society for Microbiology* (preprint DOI: 10.64898/2026.10.08.757403)

Machine Learning Researcher Intern, NASA Johnson Space Center, Houston, TX 2021–2022

Mentor: Terry Hill, Senior Data Scientist, Engineering Directorate

- Developed an analysis pipeline for historical engineering failure reports to discover root causes and process associations; built an NLP taxonomy for space-hardware failure reporting using LDA-BERT
- Built Power BI dashboards to identify correlations, trends, and root causes; tested commercial NLP tools (IBM Watson Explorer, AWS Comprehend, Google Cloud Platform) and open-source ML techniques
- Created interactive knowledge graphs using INDRA-EIDOS, spaCy, and Bokeh-networkx to map cause-effect relationships; identified 5–15 critical engineering processes; 8 presentations; 1 peer-reviewed

publication in *Scientific Reports* (DOI: 10.1038/s41598-026-36813-7)

Undergraduate Researcher, University of Houston, Houston, TX 2020–2021

Advisor: Dr. Pavan Hosur, Assistant Professor, Department of Physics

- Studied the theoretical possibilities of asymmetric superconductivity under broken symmetries; modeled asymmetric supercurrents in non-centrosymmetric superconductors using the time-dependent Schrödinger equation
- Derived Josephson effects and calculated asymmetric supercurrent density across 3D lattice parameters; explored the FFLO state using mean-field theory and identified phase transitions from the BdG Hamiltonian
- 1 conference presentation; 1 peer-reviewed publication in *Physical Review B* (DOI: 10.1103/PhysRevB.108.094513)

Additional (minor) research experiences and earlier positions are listed in the Appendix.

Invited Talks

NASA Ames Research Center Space Biosciences Research Branch August 2022
NASA JSC Engineering Directorate — NLP Research Outcomes May 2022
NASA Langley Research Center ML/AI Community Group July 2021

See Appendix for complete presentation list.

LEADERSHIP, COMMUNITY SERVICE & TEACHING

Teaching Experience

Teaching Assistant, Baylor College of Medicine, Houston, TX 2023–2025
Quantitative & Computational Methods for Biosciences (QCMB 1: 2023–2024; QCMB 2: 2025)
Responsibilities: Lecture support, assignment/exam grading, development of supplementary materials emphasizing Probability Theory and ML applications

Graduate Student Leadership

Graduate Student Council Representative, QCB Program 2024–Present
Chair, International Student Committee; Career Development Committee Member; Newsletter Committee Writer

Mentorship

Research Mentor 2022–2025
Mentored 7 trainees (2 NASA Ames interns; 1 PREP mentee; 1 SMS mentee; 3 ASPIRE mentees), providing guidance in research execution, professional development, and graduate school preparation. Contributed with collaborators to the development of dozens of conference abstracts and presentations.

Committee Memberships & Service

Keck Seminar Committee 2024
Lathisms Committee 2024
Lunar Biology Technology Workshop Scribe, NASA 2022
SACNAS Officer, University of Houston 2021

AWARDS

GSBS Outstanding TA in Quantitative & Computational Biosciences, BCM	2025
Dean's Award of Excellence, Baylor College of Medicine	2024
NSF Graduate Research Fellowship, National Science Foundation	2024
NLM Fellowship T15LM007093-32, National Library of Medicine	2023
Lathisms Scholarship	2023
ASM Future Leaders Mentoring Fellowship	2023
ADDSTEAM Scholarship	2022
IMSD NIH-NIGMS Grant 5R25GM056929-25	2022
Magna Cum Laude, University of Houston	2022
Charles P. Benner Scholarship	2021
Provost's Undergraduate Research Scholarship, University of Houston	2021
The British American Foundation of Texas Scholarship	2021
Summer Undergraduate Research Fellowship, University of Houston	2020
Dean's Distinguished Scholar, University of Houston	2018–2022
Academic Excellence Scholarship, University of Houston	2018–2022

SOFTWARE

AMMPER — Agent-Based Model for Microbial Populations Exposed to Radiation; optimized simulation model for microbe cells under ionizing deep-space radiation, used in collaboration with NASA Biosentinel and LEIA missions.

Texas Children's Hospital Mentor Matching — RAG system for matching a mentee with TCH mentors given a CV or interest description.

OverlapPlots — R package for analyzing gene expression variations in neurological diseases, particularly synaptic dysfunction.

GRANT CONTRIBUTIONS

BCM Seed Grant (PI: Alison Goulding)	Awarded
dkNET NIDDK Grant (PI: Dr. Tosur)	Awarded

Additional proposal-writing contributions are listed in the Appendix.

CERTIFICATIONS & TRAINING

Graduate Tools & Models in Data Science — Rice University | Machine Learning Certificate — Hewlett Packard Enterprise Data Science Institute | Big Data Technology Fundamentals — Amazon Web Services/NASA | Data Analysis Concepts — Percipio/NASA | ETS Major Field Test in Mathematics: 198/200

Appendix: Additional Research Experience

These are minor or earlier research experiences that did not result in a first/contributing manuscript on the project's central topic, along with proposal contributions that were not funded. Primary, publication-generating experiences appear in the main *Research & Industry Experience* section.

Additional Graduate Projects — Baylor College of Medicine, Houston, TX 2022–Present

Liu Lab, Data Science Center, Duncan NRI, Texas Children's Hospital | Advisor: Dr. Zhandong Liu

- **AI Synapse (Pediatric Oncology Clinical Decision Support):** Built a Palantir AIP agent with an Ontology-Augmented Generation (OAG) system embedding pediatric cancer clinical notes alongside practice guidelines; benchmarked multiple foundation models on 68 clinician-curated multiple-choice questions (best: GPT-5.4, 94.1%) with note/guideline ablations and error analysis. Conference abstract submitted.
- **Semantic Patient Matching:** Developed an LLM-guided, RAG-based system that retrieves clinically similar patients from complete clinical-note histories to support treatment decisions, particularly for rare-disease applications; benchmarked on an annotated MIMIC-IV subset, GPT-generated synthetic rare-disease narratives, and a Texas Children's Hospital rare-disease cohort.
- **Pediatric Epilepsy and Sleep Disorders:** Curated a $\sim$30,000-patient epilepsy cohort ($\sim$7,000 with comorbid sleep disorders) from the TCH OMOP database; applied LLM workflows (Claude on AWS Bedrock) for seizure-event extraction and clustering/enrichment analysis of treatment response, validated by clinical experts.
- **Rare Disease and Immunodeficiency Phenotyping:** Built LLM/RAG workflows to extract HPO terms from clinical notes for rare-disease and immunodeficiency cohorts; benchmarked against ClinPhen, Doc2HPO, FastHPOCR, and PhenoGPT with expert validation, and developed an LLM-based genetic-report parsing tool.
- **Prenatal HPO Phenotype Extraction:** Benchmarked six phenotype-extraction approaches (PhenoGPT, Doc2HPO, ClinPhen, FastHPOCR, GPT-5.1, and a Claude RAG pipeline) on prenatal clinical notes for downstream rare-disease analysis.
- **Deep Learning for Genetic Disease Analysis:** Engineered CNN/DNN/Transformer (DNA-BERT) models to classify genetic sequences and identify SNPs associated with alternative polyadenylation and genetic disease.
- **OverlapPlot (BioConductor R Package):** Developed and enhanced an open-source R package for analyzing gene-expression variation and synaptic dysfunction in neurological disease.

Graduate Rotation, UT MD Anderson Cancer Center, Houston, TX 2021

Mentor: Dr. Han Liang, Department of Bioinformatics and Computational Biology

- Assisted the DrBioRight AI team in building web-based single-cell visualization tools (UMAP, t-SNE, batch correction, dot plots), enabling accessible single-cell data exploration for non-computational researchers.

Graduate Rotation, Baylor College of Medicine, Houston, TX 2021

Mentor: Dr. Zhang, Proteomics Data Analysis Center

- Designed a CLAMP/BioBERT text-mining pipeline to extract substrate–kinase phosphorylation relationships and annotate phosphorylation events from the PMC Open Access subset.

Undergraduate Researcher, University of Houston, Houston, TX 2019–2020

Advisor: Dr. Anthony Timmins, Department of Physics, Relativistic Heavy Ion Group

- Ran Pb–Pb collision simulations (OSU Hydro, TRENTo) of quark–gluon plasma viscosity, validating simulated flow harmonics against ALICE/CERN data and applying bootstrapping to quantify model uncertainty.

Research Fellow, Rice University, Houston, TX 2019

Advisors: Dr. Margaret Cheung and Dr. Seth Coleman, Center for Theoretical Biological Physics

- Built a gene-regulatory-network model of Cro–CI transcription-factor dynamics and cell-fate decisions in bacteriophage lambda using Michaelis-Menten kinetics and differential equations in MATLAB; 2 poster presentations.

Additional Grant-Writing Contributions

*Proposals contributed to that were not funded; awarded grants appear in the main **Grant Contributions** section.*

- **K23 Mentored Patient-Oriented Research Career Development Award** (PI: Alison Goulding) — contributed to proposal development and writing, including the computational aims, preliminary data, and analysis. Submitted, not funded.
- **ASPIRE** (PI: Dr. Zhandong Liu) — contributed to proposal development and writing, including the computational aims, preliminary data, and analysis. Submitted, not funded.
